

Let's build a Snail Habitat (home)

1. Find a container to use (Clear plastic is best for viewing) ex. Berry containers, old plastic shoebox.
2. If there isn't an opening big enough for your hand, cut one in the top
3. Puncture air holes in the top
4. Inside: soil (keep moist but not swampy), rocks, twigs, leaves, moss, enough to make a nice home but not too crowded (do not add a water dish!! They don't need it and it could cause drowning)
5. Use a spray bottle to provide adequate humidity for the snail (not dry like a desert but not wet like a swamp)
6. Food: Snails love vegetables like lettuce, Carrots, raw greens
7. Once your snail home is set up you need to go exploring outside and find a few snails to live in their new habitat. (snails are nocturnal (sleep in the day and awake at night) look under leaves, pieces of wood, in and under leafy plants.
8. Keep your snail home out of direct sunlight, let them go when you are no longer interested in looking after them
9. Take a picture or video and let me know how it works out 😊
